CLSI QMS14™

Quality Management System: Leadership and Management Roles and Responsibilities

CLSI QMS14 presents concepts and information to assist a laboratory in meeting leadership requirements for its quality management system. Guidance is provided for leaders to effectively design, implement, and maintain the cultural, structural, and functional aspects of their laboratory that are critical to managing and sustaining quality.

A guideline for global application developed through the Clinical and Laboratory Standards Institute consensus process.

Clinical and Laboratory Standards Institute

Setting the standard for quality in medical laboratory testing around the world.

The Clinical and Laboratory Standards Institute (CLSI) is a not-for-profit membership organization that brings together the varied perspectives and expertise of the worldwide laboratory community for the advancement of a common cause: to foster excellence in laboratory medicine by developing and implementing medical laboratory standards and guidelines that help laboratories fulfill their responsibilities with efficiency, effectiveness, and global applicability.

Consensus Process

Consensus—the substantial agreement by materially affected, competent, and interested parties—is core to the development of all CLSI documents. It does not always connote unanimous agreement but does mean that the participants in the development of a consensus document have considered and resolved all relevant objections and accept the resulting agreement.

Commenting on Documents

CLSI documents undergo periodic evaluation and modification to keep pace with advances in technologies, procedures, methods, and protocols affecting the laboratory or health care.

CLSI's consensus process depends on experts who volunteer to serve as contributing authors and/or as participants in the reviewing and commenting process. At the end of each comment period, the committee that developed the document is obligated to review all comments, respond in writing to all substantive comments, and revise the draft document as appropriate.

Comments on published CLSI documents are equally essential and may be submitted by anyone, at any time, on any document. All comments are managed according to the consensus process by a committee of experts.

Appeal Process

When it is believed that an objection has not been adequately considered and responded to, the process for appeal, documented in the CLSI *Standards Development Policies and Processes*, is followed.

All comments and responses submitted on draft and published documents are retained on file at CLSI and are available upon request.

Get Involved—Volunteer!

Do you use CLSI documents in your workplace? Do you see room for improvement? Would you like to get involved in the revision process? Or maybe you see a need to develop a new document for an emerging technology? CLSI wants to hear from you. We are always looking for volunteers. By donating your time and talents to improve the standards that affect your own work, you will play an active role in improving public health across the globe.

For additional information on committee participation or to submit comments, contact CLSI.

Abstract

Clinical and Laboratory Standards Institute QMS14-Ed2—*Quality Management System: Leadership and Management Roles and Responsibilities* assists laboratories in meeting the leadership-based requirements for a QMS, as represented by quality system essential Organization and Leadership. It presents a conceptual framework of three organizational dimensions (ie, cultural, structural, and functional) and provides content for managing laboratory quality.

Clinical and Laboratory Standards Institute (CLSI). *Quality Management System: Leadership and Management Roles and Responsibilities*. 2nd ed. CLSI guideline QMS14 (ISBN 978-1-68440-254-0 [Print]; ISBN 978-1-68440-255-7 [Electronic]). Clinical and Laboratory Standards Institute, USA, 2024.

The Clinical and Laboratory Standards Institute consensus process, which is the mechanism for moving a document through two or more levels of review by the health care community, is an ongoing process. Users should expect revised editions of any given document. Because rapid changes in technology may affect the procedures, methods, and protocols in a standard or guideline, users should replace outdated editions with the current editions of CLSI documents. Current editions are listed in the CLSI catalog and posted on our website at www.clsi.org.

Foreword

Quality system essential (QSE) Organization and Leadership is one of the 12 QSEs described in CLSI QMS01,¹ which provides the necessary background information and guidance to develop and maintain a QMS. The QMS model depicted in Figure 1 demonstrates that each QSE, such as Organization and Leadership, is a building block to quality and is necessary to support any laboratory's path of workflow from preexamination to examination to postexamination.

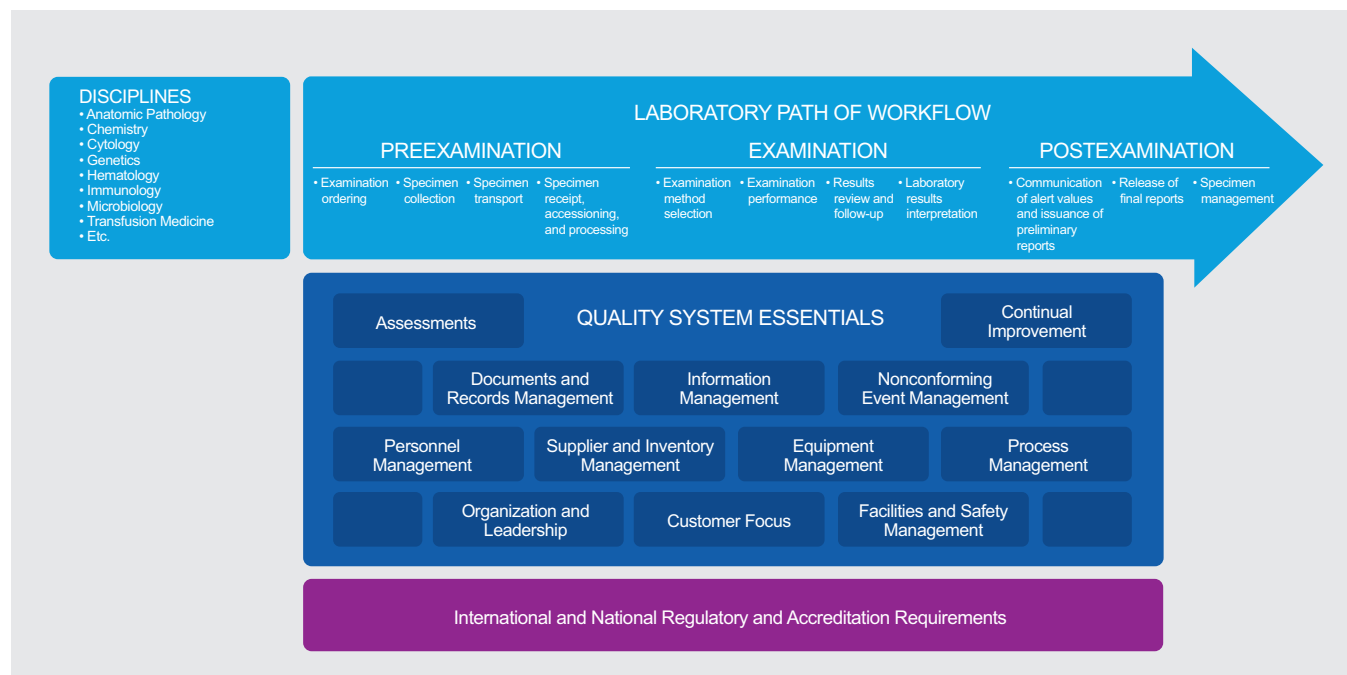

Figure 1. The QMS Model for Laboratory Services (see CLSI QMS01¹). The 12 QSEs are building blocks necessary to support any laboratory's path of workflow. This figure represents how the 12 QSEs support a medical laboratory's disciplines and stages of examination.

QSEs are the foundational building blocks that function effectively to support the laboratory's path of workflow. If a QSE is missing or poorly implemented, problems will occur in preexamination, examination, and postexamination processes. For example, when the laboratory lacks defined processes for properly installing, calibrating, and maintaining its analyzers so that they are working effectively, there will be problems in examination processes.

International guidance for the QSEs and the laboratory's path of workflow is available. Topics include:

- A process-based model for quality that any business should use to manage its operations, with information relating directly to the QSEs²
- Requirements for both quality management and technical operations of testing and calibration laboratories³
- Standards for quality management and technical operations in the medical laboratory environment⁴

Experience has shown that a laboratory's success in implementing and maintaining a QMS depends on laboratory leadership setting the expectation that quality management is the laboratory's "way of doing business" rather than an added activity. Leaders should then foster a culture that supports this expectation and should also actively participate in all aspects of managing quality.

Active and ongoing participation of the laboratory’s leadership in defining the laboratory’s quality policy, planning for quality, allocating resources to achieve quality goals, seeking customer feedback, and receiving and acting on information derived from quality status reports is essential to an effective QMS. An effective QMS results in the continual improvement of the laboratory’s service and enables the laboratory to sustain its performance improvements, thereby more consistently meeting the needs of its customers.

To impress upon laboratory leaders the importance of their role in quality, regulatory and accreditation organizations have specific requirements for laboratory leadership. Leadership requirements can be stated explicitly as leadership standards or can be implicit and integrated with other requirements. When a laboratory documents its intention for leadership in policies and transforms the stated intent into action through its processes and procedures, the requirements (summarized in CLSI QMS01¹) can be met.

This guideline assists laboratories in meeting leadership requirements for their QMS. A conceptual framework comprising three organizational dimensions (ie, cultural, structural, and functional) is introduced, and content for managing laboratory quality is provided for each dimension. This guideline’s content was developed to enhance the effectiveness of leadership at shaping (ie, designing, implementing, and maintaining) the quality-related aspects of each dimension, thereby supporting leaders in fulfilling their QMS roles and responsibilities.

This guideline presents the leadership requirements described in QSE Organization and Leadership, and aspects that enable the successful development, implementation, and/or maintenance of:

- A quality policy
- An appropriate scope of services
- An organizational structure to ensure quality
- Roles and responsibilities to carry out the work processes and activities of the QMS
- An appropriately designed and integrated QMS
- A process for resource management in support of the QMS and provision of laboratory services
- A process for quality planning
- A process for review of performance to assess the effectiveness of the QMS
- A program or plan for ongoing communication of quality-related information

CLSI QMS14 is a **guideline** that can help laboratories implement leadership and management roles and responsibility and meet international standards and regulatory and accreditation requirements.²⁻¹² **CLSI QMS14 is not a standard**; that is, this guideline **does not set requirements** for organization and leadership. Rather, it provides suggestions and examples for fulfilling the requirements.

Overview of Changes

This guideline was revised in 2024 under the limited revision process and replaces the 1st edition of the guideline, which was published in 2012. Several changes were made in this edition, including:

- Aligning content to the content in the current edition of CLSI QMS01¹
- Eliminating content now covered in CLSI documents that did not exist when this guideline was published in 2012.
- Aligning CLSI QMS14 to the updated CLSI document template.

Introduction

Quality Management System: Leadership and Management Roles and Responsibilities

1 Introduction

1.1 Scope

This guideline can be used by organizations and individuals involved in managing or operating preexamination, examination, and postexamination laboratory processes. It is applicable to:

- Medical laboratories
- Blood gas laboratories
- Blood donor and pretransfusion testing laboratories
- Public health laboratories
- Clinical research laboratories

This guideline does not describe, in detail, topics and content covered in other CLSI documents. In addition, it does not reference requirements specific to any regulatory agency or accreditation organization. It is suggestive and not prescriptive in approach. It is not a comprehensive instructional manual for applying the concepts discussed, and it does not include detailed instructions or plans for how to design an organizational structure, implement a QMS, allocate resources, or create quality policies, processes, or procedures.

The concepts, descriptions, and examples provided apply to laboratories of any size, functional complexity, scope of service, and organizational structure. This guideline is applicable to any laboratory's QMS, regardless of its comprehensiveness and stage of development. This guideline is also applicable regardless of the regulations or accreditation program followed by a laboratory. Laboratories can use this guideline to assist in justifying the need for a QMS, designing or implementing a QMS, and/or maintaining and improving an established QMS.

1.2 Background

The competence with which laboratory leadership fulfills the role of “quality leader” and the attention paid to leadership responsibilities for the QMS often determines a laboratory's success in realizing the full benefits of a systematic approach to managing quality. The full benefit of a QMS can be visualized as a laboratory that sustains excellence and quality by providing a service that consistently meets or exceeds the needs of internal and external customers, while meeting all applicable regulatory and accreditation requirements. For a medical laboratory that serves patients, an effective QMS enables the laboratory to contribute to safe care and positive patient outcomes.

The occasionally voiced opinion, “Quality begins at the top,” acknowledges that the laboratory's leaders have unique roles and responsibilities in shaping the organizational dimensions relevant to managing and sustaining quality. The QMS leadership-based requirements, as represented by QSE Organization and Leadership, reflect the need to attend to organizational dimensions if laboratories are to maintain highly effective and efficient laboratory work processes that consistently meet customers' needs. The organizational dimensions are:

- Cultural
- Structural
- Functional
