

CGA C-17—2014

**METHODS TO AVOID AND
DETECT INTERNAL GAS
CYLINDER CORROSION**

SECOND EDITION

CGA

Compressed Gas Association

The Standard For Safety Since 1913

PREFACE

As part of a program of harmonization of industry standards, the Compressed Gas Association (CGA) has issued CGA C-17, *Methods to Avoid and Detect Internal Gas Cylinder Corrosion*, jointly produced by members of the International Harmonization Council and originally published by the European Industrial Gases Association (EIGA) as EIGA Doc 62, *Methods to avoid and detect internal gas cylinder corrosion*.

This publication is intended as an international harmonized standard for the worldwide use and application of all members of the Asia Industrial Gases Association (AIGA), Compressed Gas Association (CGA), European Industrial Gases Association (EIGA), and Japan Industrial and Medical Gases Association (JIMGA). Each association's technical content is identical, except for regional regulatory requirements and minor changes in formatting and spelling.

PLEASE NOTE:

The information contained in this document was obtained from sources believed to be reliable and is based on technical information and experience currently available from members of the Compressed Gas Association, Inc. and others. However, the Association or its members, jointly or severally, make no guarantee of the results and assume no liability or responsibility in connection with the information or suggestions herein contained. Moreover, it should not be assumed that every acceptable commodity grade, test or safety procedure or method, precaution, equipment or device is contained within, or that abnormal or unusual circumstances may not warrant or suggest further requirements or additional procedure.

This document is subject to periodic review, and users are cautioned to obtain the latest edition. The Association invites comments and suggestions for consideration. In connection with such review, any such comments or suggestions will be fully reviewed by the Association after giving the party, upon request, a reasonable opportunity to be heard. Proposed changes may be submitted via the Internet at our web site, www.cganet.com.

This document should not be confused with federal, state, provincial, or municipal specifications or regulations; insurance requirements; or national safety codes. While the Association recommends reference to or use of this document by government agencies and others, this document is purely voluntary and not binding unless adopted by reference in regulations.

A listing of all publications, audiovisual programs, safety and technical bulletins, and safety posters is available via the Internet at our website at www.cganet.com. For more information contact CGA at Phone: 703-788-2700, ext. 799. E-mail: customerservice@cganet.com.

1 Introduction

There are a number of reasons for a cylinder to fail while in service from abuse, misuse, manufacturing flaws, and internal corrosion. A number of gases can react with moisture to produce corrosive media that could react with the cylinder material and lead to a cylinder failure. The number of incidents resulting from internal corrosion is relatively small compared to the number of cylinders in service because the industry follows procedures to reduce moisture in cylinders.

2 Scope and purpose

This publication provides guidance to help prevent and detect internal corrosion of compressed gas cylinders. It applies to gas cylinders and bundles of cylinders, including cylinder installations at customer sites.

The main emphasis of this publication focuses on steel cylinders containing oxygen/oxygen mixtures and carbon dioxide/carbon dioxide mixtures in the presence of moisture. Certain aspects of this publication can also apply to other gases such as hydrogen chloride.

3 Definitions

For the purpose of this publication, the following definitions apply.

3.1 Publication terminology

3.1.1 Shall

Indicates that the procedure is mandatory. It is used wherever the criterion for conformance to specific recommendations allows no deviation.

3.1.2 Should

Indicates that a procedure is recommended.

3.1.3 May

Indicate that the procedure is optional.

3.1.4 Will

Is used only to indicate the future, not a degree of requirement.

3.1.5 Can

Indicates a possibility or ability.

3.2 Technical definitions

3.2.1 Corrosion

Reaction of the cylinder material with certain aqueous media (e.g., carbonic acid formed from carbon dioxide and water).

3.2.2 Corrosive gas

Gas in a cylinder that will interact with the cylinder material in an oxidizing manner in the presence of moisture.

3.2.3 Hydraulic test

Test performed on the cylinder using an aqueous solution such as a test to check for leaks (proof test) or an expansion test (hydrostatic test).
